

Spiralling Domains in Dimension 2

Jasmin Raissy

Institut de Mathématiques de Bordeaux

(Joint work in progress with Xavier Buff)

June 29, 2023

Goal: understand the **parabolic basin** \mathcal{B}_0 of $F: \mathbb{C}^n \rightarrow \mathbb{C}^n$ such that $F(0) = 0$ and $D_0F = \text{id}$

$$\mathcal{B}_0 = \{z \in \mathbb{C}^n \mid F^{\circ m}(z) \xrightarrow{m \rightarrow +\infty} 0\}$$

Parabolic domain: connected component P of $\mathring{\mathcal{B}}_0$, $F(P) \subset P$.

Theorem (Buff-R., in progress)

*There exist $F: \mathbb{C}^2 \rightarrow \mathbb{C}^2$ polynomial maps tangent to the identity at the origin with **infinitely many** parabolic domains of **spiralling type**.*

Dimension 1

- $f : (\mathbb{C}, 0) \rightarrow (\mathbb{C}, 0)$ tangent to the identity and $f \neq \text{id}$:

$$f(z) = z + az^{k+1} + O(z^{k+2}) \quad \text{with} \quad a \in \mathbb{C} \setminus \{0\}.$$

$k = 3$

Dimension 1

- $f : (\mathbb{C}, 0) \rightarrow (\mathbb{C}, 0)$ tangent to the identity and $f \neq \text{id}$:

$$f(z) = z + az^{k+1} + O(z^{k+2}) \quad \text{with } a \in \mathbb{C} \setminus \{0\}.$$

$$k = 3$$

f is topologically conjugate to the time-1 flow of $z^{k+1} \frac{\partial}{\partial z}$.

Dimension 2

Setting:

- $\mathbf{z} = \begin{pmatrix} x \\ y \end{pmatrix} \in \mathbb{C}^2$
- $F(\mathbf{z}) = \mathbf{z} + v(\mathbf{z}) + O(\|\mathbf{z}\|^{k+2}), k \geq 1$
- $v : \mathbb{C}^2 \rightarrow \mathbb{C}^2$ homogeneous map of degree $k + 1$.

Dimension 2

Setting:

- $\mathbf{z} = \begin{pmatrix} x \\ y \end{pmatrix} \in \mathbb{C}^2$
- $F(\mathbf{z}) = \mathbf{z} + v(\mathbf{z}) + O(\|\mathbf{z}\|^{k+2}), k \geq 1$
- $v : \mathbb{C}^2 \rightarrow \mathbb{C}^2$ homogeneous map of degree $k + 1$.

Idea: Look at $\vec{v}(\mathbf{z})$

- search for **preferred directions** for the dynamics
- understand orbits of f using **real time** trajectories of $\vec{v}(\mathbf{z})$.

$$F(\mathbf{z}) = \mathbf{z} + v(\mathbf{z}) + O\left(\|\mathbf{z}\|^{k+2}\right), \quad F^{\circ n}(\mathbf{z}) = \mathbf{z}_n$$

Fact: $\mathbf{z}_n \rightarrow \mathbf{0}$ tangentially to $[\mathbf{t}] \in \mathbb{P}^1(\mathbb{C}) \implies \exists \lambda \in \mathbb{C}$ s.t. $v(\mathbf{t}) = \lambda \mathbf{t}$.

- $[\mathbf{t}] \in \mathbb{P}^1(\mathbb{C})$ is a **characteristic direction** if $v(\mathbf{t}) = \lambda \mathbf{t}$. $[\mathbf{t}]$ is **non-degenerate** if $\lambda \neq 0$, **degenerate** if $\lambda = 0$.
- v is **dicritical** if all directions are characteristic, **non-dicritical** otherwise.

$$F(\mathbf{z}) = \mathbf{z} + v(\mathbf{z}) + O\left(\|\mathbf{z}\|^{k+2}\right), \quad F^{\circ n}(\mathbf{z}) = \mathbf{z}_n$$

Fact: $\mathbf{z}_n \rightarrow \mathbf{0}$ tangentially to $[\mathbf{t}] \in \mathbb{P}^1(\mathbb{C}) \implies \exists \lambda \in \mathbb{C}$ s.t. $v(\mathbf{t}) = \lambda \mathbf{t}$.

- $[\mathbf{t}] \in \mathbb{P}^1(\mathbb{C})$ is a **characteristic direction** if $v(\mathbf{t}) = \lambda \mathbf{t}$. $[\mathbf{t}]$ is **non-degenerate** if $\lambda \neq 0$, **degenerate** if $\lambda = 0$.
- v is **dicritical** if all directions are characteristic, **non-dicritical** otherwise.

From now on: v non-dicritical

Maps tangent to the identity in dimension 2

Assumptions:

- \vec{v} is a homogeneous vector field of degree $k + 1$ on \mathbb{C}^2 :

$$\vec{v} := U\partial_x + V\partial_y$$

with U and V homogeneous polynomials of degree $k + 1$;

$$\Phi := xV - yU$$

vanishes on $k + 2$ *characteristic directions*, counting multiplicities;

$$F(\mathbf{x}) = \mathbf{x} + \vec{v}(\mathbf{x}) + O(\|\mathbf{x}\|^{k+2}).$$

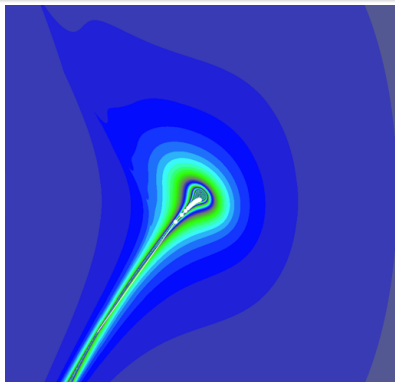

Observation:

- Near $\mathbf{0}$, orbits of F shadow real-time trajectories of \vec{v} .

Known results

Theorem (Écalle, Hakim, Abate, . . . , López-Hernanz, Rosas)

For any F , tangentially to each characteristic direction, there is either a curve of fixed points, or at least one parabolic petal.

$$F(x, y) = (x + y^2 + x^3, y + x^2)$$

Known results

Proposition (Écalle, Hakim)

Existence of F which have *parabolic domains* on which orbits converge to $\mathbf{0}$ tangentially to a characteristic direction.

$$F(x, y) = (x + x^2, y + y^2)$$

Known results

If an orbit converges to the origin, does it converge tangentially to a characteristic direction?

Known results

If an orbit converges to the origin, does it converge tangentially to a characteristic direction?

Proposition (Rivi, Rong)

Existence of F which have *parabolic domains* on which orbits converge to $\mathbf{0}$ *spiralling* around a characteristic direction.

Known results

Proposition (Rivi, Rong)

Existence of F which have *parabolic domains* on which orbits converge to $\mathbf{0}$ *spiralling* around a characteristic direction.

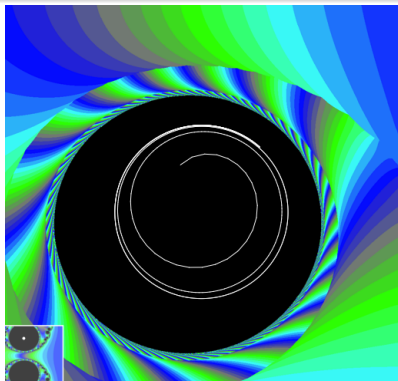

$$F(x, y) = (x - x^2, y + y^2 + 4x^2)$$

Example by Astorg and Boc-Thaler

Known results

Proposition (Rivi, Rong)

Existence of F which have *parabolic domains* on which orbits converge to $\mathbf{0}$ *spiralling* around a characteristic direction.

$$F(x, y) = (x - x^2, y + y^2 + 4x^2)$$

Example by Astorg and Boc-Thaler

Spiralling domains in dimension 2

Theorem (Buff-R., in progress)

For $a \in \mathbb{R} \setminus \{0\}$, the polynomial endomorphism $F_a : \mathbb{C}^2 \rightarrow \mathbb{C}^2$ defined by

$$F_a \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} y^2 \\ x^2 \end{pmatrix} + a \begin{pmatrix} x(x-y) \\ y(x-y) \end{pmatrix}$$

has infinitely many spiralling domains contained in distinct invariant Fatou components.

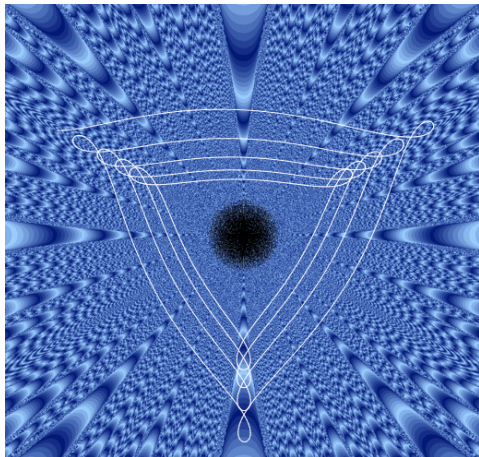

Tools

- homogeneous vector fields;
- affine surfaces;
- triangular billiards.

The family F_a

$$F_a \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} y^2 \\ x^2 \end{pmatrix} + a \begin{pmatrix} x(x-y) \\ y(x-y) \end{pmatrix}$$

The dynamics of F_a for $a = 0$

Trajectories for $\vec{v} = y^2 \frac{\partial}{\partial x} + x^2 \frac{\partial}{\partial y}$

- \vec{v} is a Hamiltonian vector field
- Complex trajectories of \vec{v} :

$$\mathcal{S}_\kappa := \{\mathbf{z} \in \mathbb{C}^2 \mid \Phi(\mathbf{z}) := x^3 - y^3 = \kappa\} \text{ with } \kappa \in \mathbb{C}.$$

- $\mathcal{S}_0 = \{y = x\} \cup \{y = jx\} \cup \{y = j^2x\}$ with $j = e^{\frac{2\pi i}{3}}$
- $\mathbf{0} \notin \overline{\mathcal{S}_\kappa}$ for $\kappa \neq 0$, and so real trajectories of \vec{v} in \mathcal{S}_κ do not converge to $\mathbf{0}$.
- For $\kappa \neq 0$, $\mathcal{S}_\kappa \simeq \text{Torus} \setminus \{3 \text{ points}\}$, on which \vec{v} is a translation vector field.
- If $\kappa = (p + jq)^3 r$, with $(p, q) \in \mathbb{Z}^2 \setminus \{\mathbf{0}\}$ and $r \in \mathbb{R} \setminus \{0\}$, then the real trajectories of \vec{v} are **periodic**, that is **closed**.

The dynamics of F_a for $a = 0.1$

The dynamics of F_a for $a = 0.1$

The dynamics of F_a for $a = 0.1$

The dynamics of F_a for $a = 0.1$

The dynamics of F_a for $a = 0.1$

Dynamics of homogeneous vector fields

- A trajectory for \vec{v} is a solution of the differential equation

$$\dot{\gamma} = \vec{v} \circ \gamma.$$

- Complex-time trajectories are Riemann surfaces which cover \mathbb{CP}^1 minus the characteristic directions.
- What does the projection to \mathbb{CP}^1 of a real-time trajectory look-like?

Dynamics of homogeneous vector fields

- A trajectory for \vec{v} is a solution of the differential equation

$$\dot{\gamma} = \vec{v} \circ \gamma.$$

- Complex-time trajectories are Riemann surfaces which cover \mathbb{CP}^1 minus the characteristic directions.
- What does the projection to \mathbb{CP}^1 of a real-time trajectory look-like?

Proposition (Abate-Tovena)

We may equip \mathbb{CP}^1 with the structure of an affine surface $\mathbf{S}_{\vec{v}}$ so that the projection to $\mathbf{S}_{\vec{v}}$ of real-time trajectories of \vec{v} are geodesics.

Affine surfaces and geodesics

Definition (Affine surface)

An *affine surface* \mathbf{S} is a Riemann surface whose change of charts are affine maps $z \mapsto \lambda z + \mu$ with $\lambda \in \mathbb{C} \setminus \{0\}$ and $\mu \in \mathbb{C}$.

Example: \mathbf{C} is the complex plane with its canonical affine structure.

Definition (Affine map)

A map between affine surfaces is an *affine map* if its expression in affine charts is of the form $z \mapsto \lambda z + \mu$.

Definition (Geodesic)

A curve $\delta : I \rightarrow \mathbf{S}$ defined on an interval $I \subseteq \mathbb{R}$ is a *geodesic* if δ is the restriction of an affine map $\varphi : U \rightarrow \mathbf{S}$ defined on an open subset $U \subseteq \mathbf{C}$.

An example

- The dilation plane $\tilde{\mathbf{C}}$ with underlying Riemann surface \mathbf{C} , whose affine charts are the restrictions of

$$\exp(z) : \tilde{\mathbf{C}} \rightarrow \mathbf{C} \setminus \{0\}.$$

A family of parallel geodesics in $\tilde{\mathbf{C}}$.

Nonlinearity

- The nonlinearity of a holomorphic map $\varphi : \mathbf{S} \rightarrow \mathbf{T}$ with non vanishing derivative is the 1-form \mathcal{N}_φ defined on \mathbf{S} by

$$\mathcal{N}_\varphi := d(\log \varphi') = \frac{d\varphi'}{\varphi'}.$$

- $\mathcal{N}_\varphi = 0$ if and only if φ is an affine map.
- If $\varphi : \mathbf{S} \rightarrow \mathbf{T}$ and $\psi : \mathbf{T} \rightarrow \mathbf{U}$ are holomorphic maps, then

$$\mathcal{N}_{\psi \circ \varphi} = \mathcal{N}_\varphi + \varphi^*(\mathcal{N}_\psi).$$

Affine surface of a homogeneous vector field

- $\vec{v} = U\partial_x + V\partial_y$ is homogeneous of degree $k + 1$.
- $z : \mathbb{C}\mathbb{P}^1 \ni [x : y] \mapsto \frac{x}{y} \in \widehat{\mathbb{C}}$.
- $f\left(\frac{x}{y}\right) = \frac{U(x, y)}{V(x, y)}$.
- $p\left(\frac{x}{y}\right) = \frac{xU(x, y) - yV(x, y)}{y^{k+2}}$.

Proposition

The nonlinearity of $z : \mathbf{S}_{\vec{v}} \rightarrow \mathbf{C}$ is

$$\nu := \left(\frac{p'(z)}{p(z)} - \frac{k}{z - f(z)} \right) dz.$$

Affine surface of a homogeneous vector field

- Singularities of ν are characteristic directions.
- Assume there is a simple pole and let ρ be the residue.

$$\text{Re}(\rho) > 1$$

$$\text{Re}(\rho) < 1$$

Theorem (Écalle, Hakim)

If ν has a simple pole and $\text{Re}(\rho) > 1$, there is a parabolic domain on which orbits converge to $\mathbf{0}$ tangentially to the characteristic direction.

Affine surface of a homogeneous vector field

- Singularities of ν are characteristic directions.
- Assume there is a simple pole and let ρ be the residue.

$$\rho = 1 - 2i$$

$$\rho = 1 - 4i$$

Proposition (Rivi,Rong)

If ν has a simple pole and $\operatorname{Re}(\rho) = 1$, there is a parabolic domain on which orbits converge to $\mathbf{0}$ spiralling around the characteristic direction.

Closed geodesics

- A geodesic $\delta : I \rightarrow \mathbf{S}$ is *closed* if there exists $\lambda \in (0, +\infty)$ and $t_0 < t_1$ in I such that

$$\delta(t_1) = \delta(t_0) \quad \text{and} \quad \dot{\delta}(t_1) = \lambda \dot{\delta}(t_0).$$

- Such a geodesic is *attracting* if $\lambda \in (0, 1)$.

Spiralling domains

- If an affine surface contains an attracting closed geodesic, it contains an *attracting dilation cylinder* foliated by attracting closed geodesic.

Proposition (Buff-R., in progress)

Assume $F(\mathbf{x}) = \mathbf{x} + \vec{\mathbf{v}}(\mathbf{x})$ with $\vec{\mathbf{v}}$ homogeneous. If $\mathbf{S}_{\vec{\mathbf{v}}}$ contains an attracting dilation cylinder \mathcal{C} , then F has a spiralling domain in which orbits converge to $\mathbf{0}$, spiralling towards an attracting closed geodesic of \mathcal{C} .

Proposition (Buff-R.)

Assume $a \in \mathbb{R} \setminus \{0\}$ and

$$\vec{\mathbf{v}} := (y^2 + ax(x - y))\partial_x + (x^2 + ay(x - y))\partial_y.$$

Then, $\mathbf{S}_{\vec{\mathbf{v}}}$ contains infinitely many non homotopic attracting dilation cylinders.

Polygonal models

- If

$$\vec{v} = y^2 \partial_x + x^2 \partial_y,$$

the affine surface $\mathbf{S}_{\vec{v}}$ may be obtained by gluing equilateral triangles.

Polygonal models

- If

$$\vec{v} := (y^2 + ax(x - y))\partial_x + (x^2 + ay(x - y))\partial_y.$$

the affine surface $\mathbf{S}_{\vec{v}}$ may be obtained by gluing isoscele triangles.

Polygonal models

- If

$$\vec{v} := (y^2 + ax(x - y))\partial_x + (x^2 + ay(x - y))\partial_y.$$

the affine surface $\mathbf{S}_{\vec{v}}$ may be obtained by gluing isoscele triangles.

Polygonal models

- If

$$\vec{v} := (y^2 + ax(x - y))\partial_x + (x^2 + ay(x - y))\partial_y.$$

the affine surface $\mathbf{S}_{\vec{v}}$ may be obtained by gluing isoscele triangles.

Polygonal models

- If

$$\vec{v} := (y^2 + ax(x - y))\partial_x + (x^2 + ay(x - y))\partial_y.$$

the affine surface $\mathbf{S}_{\vec{v}}$ may be obtained by gluing isoscele triangles.

Polygonal models

- If

$$\vec{v} := (y^2 + ax(x - y))\partial_x + (x^2 + ay(x - y))\partial_y.$$

the affine surface $\mathbf{S}_{\vec{v}}$ may be obtained by gluing isoscele triangles.

Polygonal models

- If

$$\vec{v} := (y^2 + ax(x - y))\partial_x + (x^2 + ay(x - y))\partial_y.$$

the affine surface $\mathbf{S}_{\vec{v}}$ may be obtained by gluing isoscele triangles.

Polygonal models

- If

$$\vec{v} := (y^2 + ax(x - y))\partial_x + (x^2 + ay(x - y))\partial_y.$$

the affine surface $\mathbf{S}_{\vec{v}}$ may be obtained by gluing isoscele triangles.

One attracting cylinder

A second attracting cylinder

A third attracting cylinder

Three attracting cylinders

Happy Birthday László!
